

Application Example:

C-MOR

Remote Surveillance of a Horse Stable without common Internet Connectivity

Application Area and Function

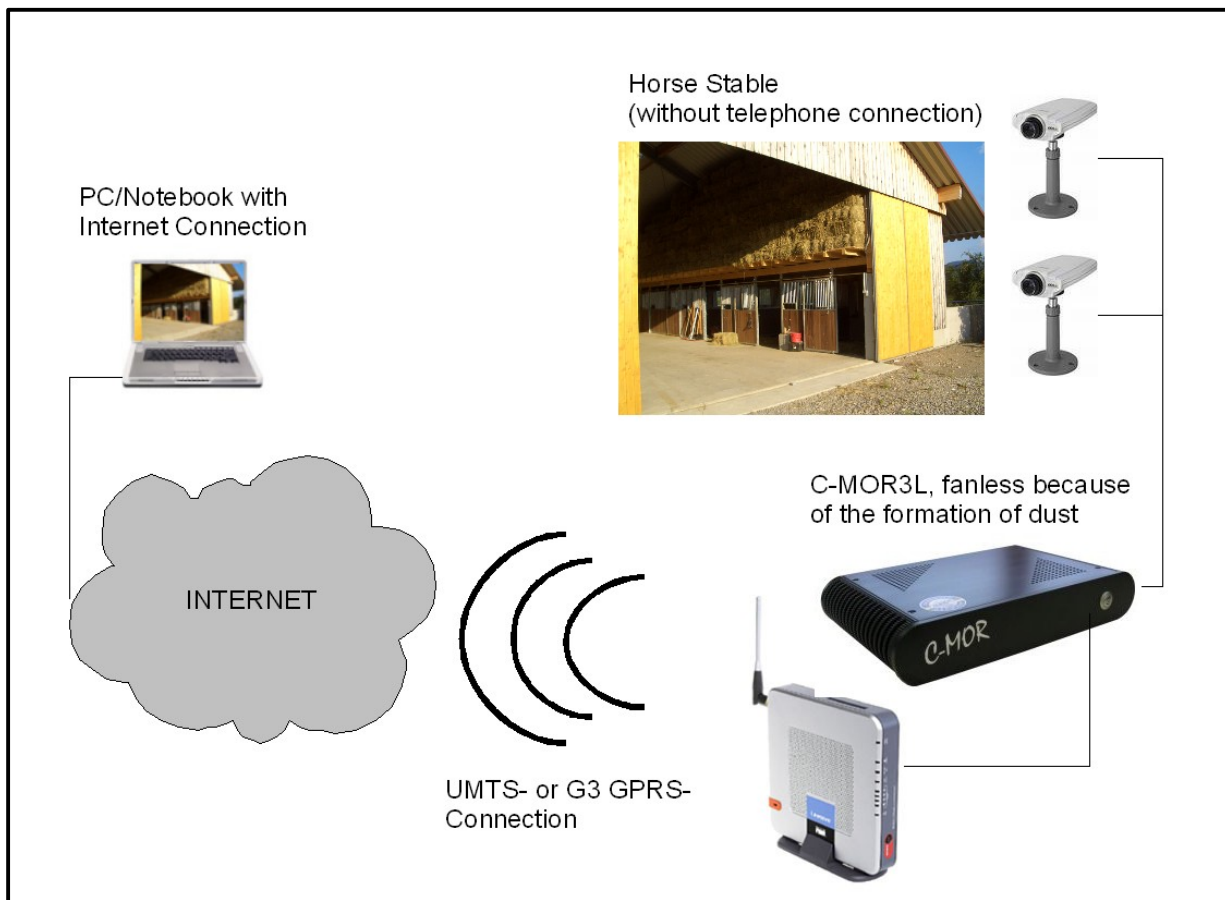

Many locations are not reachable by phone, DSL or T1/E1 connectivity. Typical Internet connections cannot be established in many remote locations preventing the deployment of many advanced C-MOR functions. C-MOR's solution to this problem is to go wireless. With the help of the UMTS Technology, outlying locations can now be monitored. C-MOR has the Technology, as shown in this Application Example, to control your far-flung site.

The Formation of Dust is not a Problem!

Because of the fan-less design of the C-MOR3L, the formation of dust is not a problem.

Used Components

C-MOR3L (fan-less), Linksys UMTS-Router, 2x Axis 210 Cameras
